

Razor Prep Blade

Bioseal's Razor Prep Blades offer a clean, sterile, and reliable alternative to reusable prep and debridement blades that cannot be consistently reprocessed or verified clean. Burn patients have extremely low infection tolerance, and their care often requires urgent bedside procedures. Sterile single use Razor Prep Blades remove the risk of trapped debris, inconsistent sharpness, and contamination from repeated handling. They also eliminate the workload and delays tied to reprocessing. With dependable performance and immediate readiness, Razor Prep Blades help protect patients while improving efficiency for clinical teams and SPD.

Why Choose Bioseal's Sterile, Single-Use Razor Prep Blades

- Provides a sterile, single-use solution designed for the realities of burn care and bedside debridement.
- Eliminates the availability challenges, reprocessing burden, and contamination risk associated with blades that have short post-sterilization windows.
- Arrives sterile and ready to use, ensuring consistent sharpness and reliable performance with every procedure.
- Removes the need for reprocessing and expiration tracking, reducing workload for SPD.
- Supports timely debridement in environments with unpredictable demand and extremely low infection tolerance.
- Helps protect vulnerable burn patients while improving clinical efficiency and operational reliability.
